# On the Limitations of Provenance for Queries With Difference 

Yael Amsterdamer Tel Aviv University and INRIA<br>Daniel Deutch Ben Gurion University and INRIA<br>Val Tannen<br>University of Pennsylvania

TaPP 2011

## Starting Point: Provenance Semirings

- Provenance semirings [(K,+, $, 0,1)]$ were originally defined for the positive relational algebra
- Two important features of semirings
- Algebraic uniformity
- A correspondence between the semiring axioms and query (bag) equivalence identities: the semiring axioms are dictated by the identities!

## Correspondence of identities

| Query Identities | Algebraic Identities |
| :---: | :---: |
| $1 \mathrm{R} \cup(\mathrm{S} \cup \mathrm{T})=(\mathrm{R} \cup \mathrm{S}) \cup \mathrm{T}$ | $\begin{gathered} \mathrm{a}+(\mathrm{b}+\mathrm{c})= \\ (\mathrm{a}+\mathrm{b})+\mathrm{c} \end{gathered}$ |
| $2 \mathrm{R} \cup \phi=\mathrm{R}$ | $a+0=a$ |
| $3 \mathrm{R} \cup \mathrm{S}=\mathrm{S} \cup \mathrm{R}$ | $a+b=b+a$ |
| $\begin{aligned} & 4 \quad \mathrm{R} \bowtie(\mathrm{~S} \bowtie \mathrm{~T})= \\ & (\mathrm{R} \bowtie \mathrm{~S}) \bowtie \mathrm{T} \end{aligned}$ | $\begin{gathered} \mathrm{a} \cdot(\mathrm{~b} \cdot \mathrm{c})= \\ (\mathrm{a} \cdot \mathrm{~b}) \cdot \mathrm{c} \end{gathered}$ |
| 5 R® 1＝R | $\mathrm{a} \cdot 1=\mathrm{a}$ |
| $6 \quad \mathrm{R} 叩 \mathrm{~S}=\mathrm{S} 叩 \mathrm{R}$ | $\mathrm{a} \cdot \mathrm{b}=\mathrm{b} \cdot \mathrm{a}$ |
| $7 \begin{gathered} \mathrm{R} \bowtie(\mathrm{~S} \cup \mathrm{~T})= \\ (\mathrm{R} \bowtie \mathrm{~S}) \cup(\mathrm{R} \triangleright \mathrm{~T}) \\ \hline \end{gathered}$ | $\begin{gathered} a \cdot(b+c)= \\ a \cdot b+a \cdot c \end{gathered}$ |
| $8 \mathrm{R} 叩 \phi=\phi$ | $\mathrm{a} \cdot 0=0$ |
|  | Semiring axioms！ |

Security $=(S$, MIN, MAX, 0,1$)$

$$
S=\{1, C, S, T, 0\}
$$

$$
\operatorname{Emp} \mathrm{C}<\mathrm{S}<\mathrm{T}<0
$$

| $\mathrm{S} \cdot \mathrm{T}=\mathrm{T}$ |  |

## Suggested semantics for difference

- m-semirings [Geerts Poggi '10]
$a-b$ is the smallest $c$ such that $a \leq b+c$
(works for naturally ordered cases:
$\mathrm{a} \leq \mathrm{b} \Leftrightarrow \exists \mathrm{c} a+\mathrm{c}=\mathrm{b}$ is an order relation)
- By encoding as a nested aggregate query [Amsterdamer D. Tannen PODS '11]
$a-b=a$ if $b=0$, otherwise 0 (for positive semirings)
- Also suggested for SPARQL
[Theoharis, Fundulaki, Karvounarakis, Christophides '10]
- Z-semantics [Green Ives Tannen '09]

## Abstracting away

- Can we extend the framework to support difference?
- Work with a structure (K, $, \cdot, \cdot 0,1,-)$
- We still want $(\mathrm{K},+,, 0,1)$ to be a semiring
- How do we define the additional operator?
- Let us try to throw in more axioms
- A subset of those that hold for bag and set semantics

## Additional Identities

| Query Identities |  | Algebraic Identities |
| :---: | :---: | :---: |
| 9 | $\mathrm{R}-\mathrm{R}=\phi$ | $\mathrm{a}-\mathrm{a}=0$ |
| 10 | $\phi-\mathrm{R}=\phi$ | $0-\mathrm{a}=0$ |
| 11 | $\begin{gathered} R \cup(S-R)= \\ S \cup(R-S) \end{gathered}$ | $\begin{gathered} a+(b-a)= \\ b+(a-b) \end{gathered}$ |
| 12 | $\begin{gathered} R-(S \cup T)= \\ (R-S)-T \end{gathered}$ | $\begin{aligned} & a-(b+c)= \\ & (a-b)-c \end{aligned}$ |
| 13 | $\begin{gathered} R \bowtie(S-T)= \\ (R \bowtie S)-(R \bowtie T) \end{gathered}$ | $\begin{gathered} \mathrm{a} \cdot(\mathrm{~b}-\mathrm{c})= \\ (\mathrm{a} \cdot \mathrm{~b})-(\mathrm{a} \cdot \mathrm{c}) \end{gathered}$ |

## Impossibility of satisfying the axioms

- Distributive lattices are particular semirings with an order relation such that
$-a+b$ is the least upper bound of $a$ and $b$
$-a \cdot b$ is the greatest lower bound of $a$ and $b$
- The security semiring, Three Value Logic are concrete examples
- Theorem If $(\mathrm{K},+, \cdot, 0,1,-)$ is an (extension of a) distributive lattice such that axioms 1-12 hold, and there exists in K two distinct elements a , b s.t. $\mathrm{a}>\mathrm{b}$ and $(a-b) \cdot b=0$ then axiom 13 fails in $K$.

## Key observation

- Let $(\mathrm{K},+, 0)$ be a naturally ordered commutative monoid
- Commutative monoid means axioms 1-3 hold
- Naturally ordered means
$\mathrm{a} \leq \mathrm{b} \Leftrightarrow \exists \mathrm{c} \mathrm{a}+\mathrm{c}=\mathrm{b}$ is an order relation
Theorem [Bosbach '65]: Axioms 9-12 hold if and only if
$\mathrm{a}-\mathrm{b}$ is the smallest c such that $\mathrm{a} \leq \mathrm{b}+\mathrm{c}$

## Key Observation (cont.)

- For the security semiring, with

$$
\begin{aligned}
& a=S, b=T \text { we get } \\
& a-b=S \text { and }(a-b) \cdot b=T=0
\end{aligned}
$$

And indeed: $(\mathrm{S}-\mathrm{T}) \cdot \mathrm{T}=\mathrm{S} \cdot \mathrm{T}=\mathrm{T}$ but

$$
\mathrm{S} \cdot \mathrm{~T}-\mathrm{T} \cdot \mathrm{~T}=\mathrm{T}-\mathrm{T}=0
$$

(S, MIN, MAX, 0,1)

$$
\begin{aligned}
& \mathrm{S}=\{1, \mathrm{C}, \mathrm{~S}, \mathrm{~T}, 0\} \\
& 1<\mathrm{C}<\mathrm{S}<\mathrm{T}<0
\end{aligned}
$$

## Where do solutions fail?

| Query Identities | Algebraic Identities |
| :---: | :---: |
| $\mathrm{R}-\mathrm{R}=\phi$ | $\begin{aligned} & \quad \text { Fail for: } \\ & a-a=0 \end{aligned}$ |
| $\phi-\mathrm{R}=\phi$ | 0 Za-Semmantics |
| $\begin{gathered} R \cup(S-R)= \\ S \cup(R-S) \end{gathered}$ | $\begin{aligned} & \mathrm{a}+\left(\mathrm{qgg} \mathrm{~g}^{\mathrm{a}}\right) \\ & \mathrm{b}+(\mathrm{a}-\mathrm{b}) \end{aligned}$ |
| $\begin{gathered} R-(S \cup T)= \\ (R-S)-T \end{gathered}$ | $\begin{gathered} a-(b+c)= \\ (a-b)-c \end{gathered}$ |
| $\begin{gathered} R \bowtie(S-T)= \\ (R \bowtie S)-(R \bowtie T) \end{gathered}$ | $\begin{aligned} & \mathrm{a} \cdot(\mathrm{~b}-\mathrm{c})=\overline{\overline{\mathrm{nem}}} \\ & (\mathrm{a} \cdot \mathrm{~b})-(\mathrm{a} \cdot \mathrm{c}) \end{aligned}$ |

## So what can we do?

- Work with a restricted class of semirings
- We show in the paper another security semiring that is not a lattice; we use sets of security levels
- Can we characterize the class for which bag equivalences hold?
- Give up on some of the equivalence axioms
- Give up on a uniform definition of difference
