</table>

This is a 4x4 grid with numbers from 1 to 15. The objective of the game is to arrange the numbers so that each row, column, and diagonal sums to 30.
5: Forensics
Teh Computer Science 50 learnz you about intertubes in teh cloudz. David J. Malan will pwn u ftw so watch out!

Self-service, Prorated Super Computing Fun!

- "The New York Times has decided to make all the public domain articles from 1851-1922 available free of charge. These articles are all in the form of images scanned from the original paper. In fact from 1851-1980, all 11 million articles are available as images in PDF format. To generate a PDF version of the article takes quite a bit of work — each article is actually composed of numerous smaller TIFF images that need to be scaled and glued together in a coherent fashion. . . . I then began some rough calculations and determined that if I used only four machines, it could take some time to generate all 11 million article PDFs. But thanks to the swell people at Amazon, I got access to a few more machines and churned through all 11 million articles in just under 24 hours using 100 EC2 instances . . . . (In fact, it work so well that we ran it twice, since after we were done we noticed an error in the PDFs.)"

- Bandwidth Costs
- “Lightning Strike Triggers Amazon EC2 Outage”
“Sometimes he spends a long time on broad concepts that we already understand, rather than focusing on details like return types or proper usage of functions. For example, he explained cloud computing like 17,000 times, and we don't even need to understand it for the psets.”

New Contestants On the Turing Test

Posted by Cmdr Taco on Wednesday October 08, @11:15AM
from the game-on dept.

vitamine73 writes

"At 9 a.m. next Sunday, six computer programs — 'artificial conversational entities' — will answer questions posed by human volunteers at the University of Reading in a bid to become the first recognized 'thinking' machine. If any program succeeds, it is likely to be hailed as the most significant breakthrough in artificial intelligence since the IBM supercomputer Deep Blue beat world chess champion Garry Kasparov in 1997. It could also raise profound questions about whether a computer has the potential to be 'conscious' — and if humans should have the 'right' to switch it off."
