U.S. vs. Hackers: Still Lopsided Despite Years of Warnings and a Recent Push

BY MICHAEL S. DODT AND MICHAEL PAULSON

WASHINGTON — In the month since a devastating computer attack brought down the Office of Personnel Management, digital threats have been on the rise, with growing concern over America’s ability to defend itself against cyber terrorism.

But some cybersecurity experts say they have a solution: a new approach to dealing with cyber threats that involves the government and private companies.

The approach, known as the “Lawfare” model, involves the government and private companies working together to better protect America’s cyberspace.

In an effort to highlight the need for a new approach, the White House announced on Tuesday that it would be launching a pilot program to test the Lawfare model.

The program, which will be run by the Department of Homeland Security, will involve government and private companies working together to develop new tools and techniques to better protect America’s cyberspace.

The program will initially focus on addressing cyber threats to critical infrastructure, such as the power grid and transportation systems.

The White House said the program will be evaluated after 18 months, and if successful, it will be expanded to other sectors.

Lawfare is just one of the many initiatives the Obama administration has launched to better protect America’s cyberspace.

The White House has also announced a series of executive orders aimed at strengthening the nation’s cyber defenses, including the creation of a new federal agency to coordinate cyber security efforts across government agencies.

But despite these efforts, experts say there is still much more work to be done.
