Errata Slip 2
Proceedings of the 25th USENIX Security Symposium

In the paper “On Omitting Commits and Committing Omissions: Preventing Git Metadata Tampering That (Re) introduces Software Vulnerabilities” by Santiago Torres-Arias, New York University; Anil Kumar Ammula and Reza Curtmola, New Jersey Institute of Technology; Justin Cappos, New York University (Thursday session, “Software Security,” pp. 379–394 of the Proceedings) the authors wish to correct the following errors:

Last paragraph of section 4.1 (Tag Teleport Attacks), page 384:

**Original text:**
Finally, Git submodules are also vulnerable, as they automatically track a tag (or branch). If a build dependency is included in a project as a part of the submodule, a package might be vulnerable via an underlying library.

**Revised text**
Finally, Git submodules are also vulnerable if used with the *--remote* parameter, as they track a remote tag (or branch). If a build dependency is included in a project as a part of the submodule, a package might be made vulnerable via an underlying library.
