When Good Services Go Wild: Reassembling Web Services for Unintended Purposes

Feng Lu, Jiaqi Zhang, and Stefan Savage, *University of California, San Diego*

The PC liked the idea of reassembling public services for unintended purposes. In particular, we enjoyed use of using cloud services to proxy HTTP requests. There were also a number of concerns, including the long term efficacy of this approach. In short, if this flaw is fixed, it is not clear that the system would still work. We also note that there are other similar techniques in existence, but not one quite like this. The committee agreed that this paper could create an interesting discussion about extensibility and malicious behavior.
