Impeding Automated Malware Analysis with Environment-sensitive Malware

Chengyu Song, Paul Royal, and Wenke Lee, *Georgia Institute of Technology*

The committee felt that this paper presented interesting new ideas on how malware could use techniques reminiscent of DRM to make analysis difficult. The techniques are clearly explained and interesting. There was some concern about which types of information work well and the limitations of each of those types. Additionally, one of the reviewers hoped that much greater emphasis was placed on countermeasures. The committee agreed that this paper could create an interesting discussion on the future of malware obfuscation.
