Fragment and Forge:
Breaking Wi-Fi Through Frame Aggregation and Fragmentation

USENIX Security ’21 (video made on April 20, 2021)

Mathy Vanhoef

NEW YORK UNIVERSITY
Advancements in Wi-Fi security

› WPA3 is continuously being updated
  › Preventing recent Dragonblood [VR20] attack
  › Securing hotspots using asymmetric crypto
Advancements in Wi-Fi security

› WPA3 is continuously being updated
  » Preventing recent Dragonblood [VR20] attack
  » Securing hotspots using asymmetric crypto
› Operating channel validation [VBDOP18]
› Beacon protection [VAP20]
› KRACK patches proven secure [CKM20]

Despite these major advancements, found **flaws in all networks** (incl. WPA2/3)
Design flaws

Implementation Flaws
Design flaws

Implementation Flaws
Implementation

Aggregation

Mixed key

Fragment cache

Implementation Flaws
Background

Sending small frames causes high overhead:

header packet1 ACK header packet2 ACK ...

This can be avoided by aggregating frames:

header' packet1 packet2 ... ACK
Background

Sending small frames causes high overhead:

header  packet1  ACK  header  packet2  ACK  ...

This can be avoided by **aggregating frames**:

header’ packet1  packet2  ...  ACK

**Problem: how to recognize** aggregated frames?
### Aggregation design flaw

<table>
<thead>
<tr>
<th>header</th>
<th>aggregated?</th>
<th>encrypted</th>
</tr>
</thead>
<tbody>
<tr>
<td>False</td>
<td>False</td>
<td>packet</td>
</tr>
<tr>
<td>True</td>
<td>metadata</td>
<td>packet1</td>
</tr>
</tbody>
</table>
Aggregation design flaw

Not authenticated

header | aggregated? | encrypted

False

packet

True

metadata | packet1 | metadata | packet2

Flip flag → payload is parsed differently → inject packets
Exploit steps

1. Get image from attacker’s server
2. Send special IPv4 packet
Exploit steps

1. Get image from attacker’s server
2. Encrypt as normal frame
3. Send special IPv4 packet
   - Encrypt as normal frame
Exploit steps

1. Get image from attacker’s server
2. Set aggregated flag
3. Encrypt as normal frame
4. Send special IPv4 packet
Exploit steps

1. Inject any packet

   $\rightarrow$ 

   **Inject** ICMPv6 RA with **malicious DNS server**
Exploit steps

1. Set aggregated flag
2. Inject special EAPOL frame
3. Encrypt as normal frame
4. Inject any packet
5. Inject ICMPv6 RA with malicious DNS server

Bug in AP → do attack w/o user interaction
(affected 2/4 of home APs)
Implementation Flaws

Aggregation

Mixed key

Fragment cache
Background

Large frames have a high chance of being corrupted:

Avoid by **fragmenting** & only retransmitting lost fragments:
Large frames have a high chance of being corrupted:

Avoid by **fragmenting** & only retransmitting lost fragments:

→ Protected header info defines place in original frame
Fragment cache design flaw

Fragments aren’t removed after disconnecting:
Fragment cache design flaw

Fragments aren’t removed after disconnecting:

\[ \text{Enc}_k(Frag_0) \]

Store fragment
Fragment cache design flaw

Fragments aren’t removed after disconnecting:

- Attacker’s $\text{Frag}_0$ and client’s $\text{Frag}_1$ is reassembled
Summary of impact

Abuse to **exfiltrate or inject packets** assuming:

1. Hotspot-like network where users distrust each other
2. Client sends fragmented frames (rare unless Wi-Fi 6)
Summary of impact

Abuse to **exfiltrate or inject packets** assuming:

1. Hotspot-like network where users distrust each other
2. Client sends fragmented frames (rare unless Wi-Fi 6)

Even the ancient **WEP protocol is affected**!

› WEP is also affected by the mixed key design flaw

→ Design flaws have been **part of Wi-Fi since 1997**
Implementation Flaws

Aggregation

Mixed key

Fragment cache
Mixed key design flaw

Fragments decrypted with **different keys** are reassembled:

\[ \text{Enc}_k(\text{Frag}_0), \text{Enc}_k(\text{Frag}_1) \rightarrow \text{Enc}_k(\text{Frag}_0) \]
Mixed key design flaw

Fragments decrypted with different keys are reassembled:

\[ \text{Enc}_k(Frag_0), \text{Enc}_k(Frag_1) \]
Mixed key design flaw

Fragments decrypted with **different keys are reassembled**:

\[ \text{Enc}_k(Frag_0), \text{Enc}_k(Frag_1) \]
\[ \text{Enc}_m(Frag_0), \text{Enc}_m(Frag_1) \]

Refresh session key from \( k \) to \( m \)
Mixed key design flaw

Fragments decrypted with different keys are reassembled:

\[ Enc_k(Frag_0), Enc_k(Frag_1) \]

\[ Enc_m(Frag_0), Enc_m(Frag_1) \]

→ Can mix fragments of different frames
Summary of impact

Abuse to **exfiltrate data** assuming:

1. Someone sends fragmented frames (rare unless Wi-Fi 6)
2. Victim will connect to server of attacker
3. Network periodically refreshes the session key
Summary of impact

Abuse to **exfiltrate data** assuming:

1. Someone sends fragmented frames (rare unless Wi-Fi 6)
2. Victim will connect to server of attacker
3. Network periodically refreshes the session key

» Combine with implementation flaw to avoid this condition
Design flaws

Implementation Flaws
Design flaws

- Plaintext frames
- Mixed fragments
- Broadcast fragments
- EAPOL forwarding
- Cloacked A-MSDUs
- Out of order fragments
- Out of order fragments
Trivial frame injection

Plaintext frames wrongly accepted:

- Depending if fragmented, broadcasted, or while connecting
Trivial frame injection

Plaintext frames wrongly accepted:

› Depending if *fragmented, broadcasted*, or while *connecting*
› Sometimes frames that *resemble a handshake* message
› Examples: Apple and some Android devices, some Windows dongles, home and professional APs, and many others!

→ Can trivially *inject frames*
Design flaws

- Plaintext frames
- Broadcast fragments
- Cloacked A-MSDUs
- Mixed fragments
- EAPOL forwarding
- Out of order frag
- No fragmentation support
No fragmentation support

Some devices don’t support fragmentation

› But they **treat fragmented frames as full frames**
› Examples: OpenBSD and Espressif chips

→ **Abuse to inject frames** under right conditions
→ **All devices are vulnerable** to one or more flaws
Created tool to test devices

Has **45+ test cases for both clients and APs**:

→ Available at [https://github.com/vanhoefm/fragattack](https://github.com/vanhoefm/fragattack)
Discussion

Design flaws took two decades to discover

Without modified drivers some attacks will fail
Discussion

Design flaws took two decades to discover

› Without modified drivers some attacks will fail
› Fragmentation & aggregation wasn’t considered important
Discussion

Design flaws took two decades to discover
› Without modified drivers some attacks will fail
› Fragmentation & aggregation wasn’t considered important

Long-term lessons:
› Adopt defences early even if concerns are theoretic
› Isolate security contexts (data decrypted with different keys)
› Keep fuzzing devices. Wi-Fi Alliance can help here!
Conclusion

› Discovered three design flaws
› Multiple implementation flaws
› Several flaws are trivial to exploit
