- What is a multi-language (polyglot) system

*Interactive language components*

*Flexibility*

*Different features*

# • Multi-language software is prevalent and impactful

Over **75%** are programmed with multiple programming languages

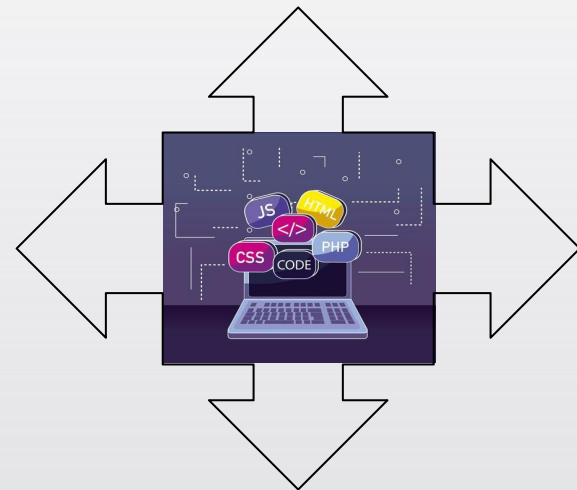

Java/c

Machine learning framework

OS

Cloud/distributed computing

Java/c

Java/c

Scientific

## • Security of multi-language systems is critical

**Security risks are consequential in multi-language systems!**

- Threats in single-language systems also exist in multi-language systems
- Threats in multi-language systems go deeper due to the greater complexity

[PolyCruise](#)@USENIX Security22, Cross-language dynamic information flow analysis

CVE-2021-33430, CVE-2021-41495, CVE-2021-41496,  
CVE-2021-34141, CVE-2021-41497, CVE-2021-41500,  
CVE-2021-41498, CVE-2021-41499

## • An example of risk of buffer-overflow cross Python-C code

```

def test_zeros_obj(self):
    .....
    with open('test_zeros', 'r') as reader:
        shape = reader.read()
    d = np.zeros(shape, dtype=int)
    .....

static PyObject *
array_zeros(PyObject *self, PyObject *args, ...) {
    PyArray_Dims shape = {NULL, 0};
    npy_parse_arguments("zeros", args, len_args, kwnames,
                       "shape", &shape, ...);
    .....
    PyArray_Zeros(shape.len, shape.ptr, ...);
    .....
}

NPY_NO_EXPORT PyObject *
PyArray_Zeros(int nd, npy_intp const *dims, ...) {
    .....
    PyArray_NewFromDescr_int(&PyArray_Type, type, nd, dims, ...);
    .....
}

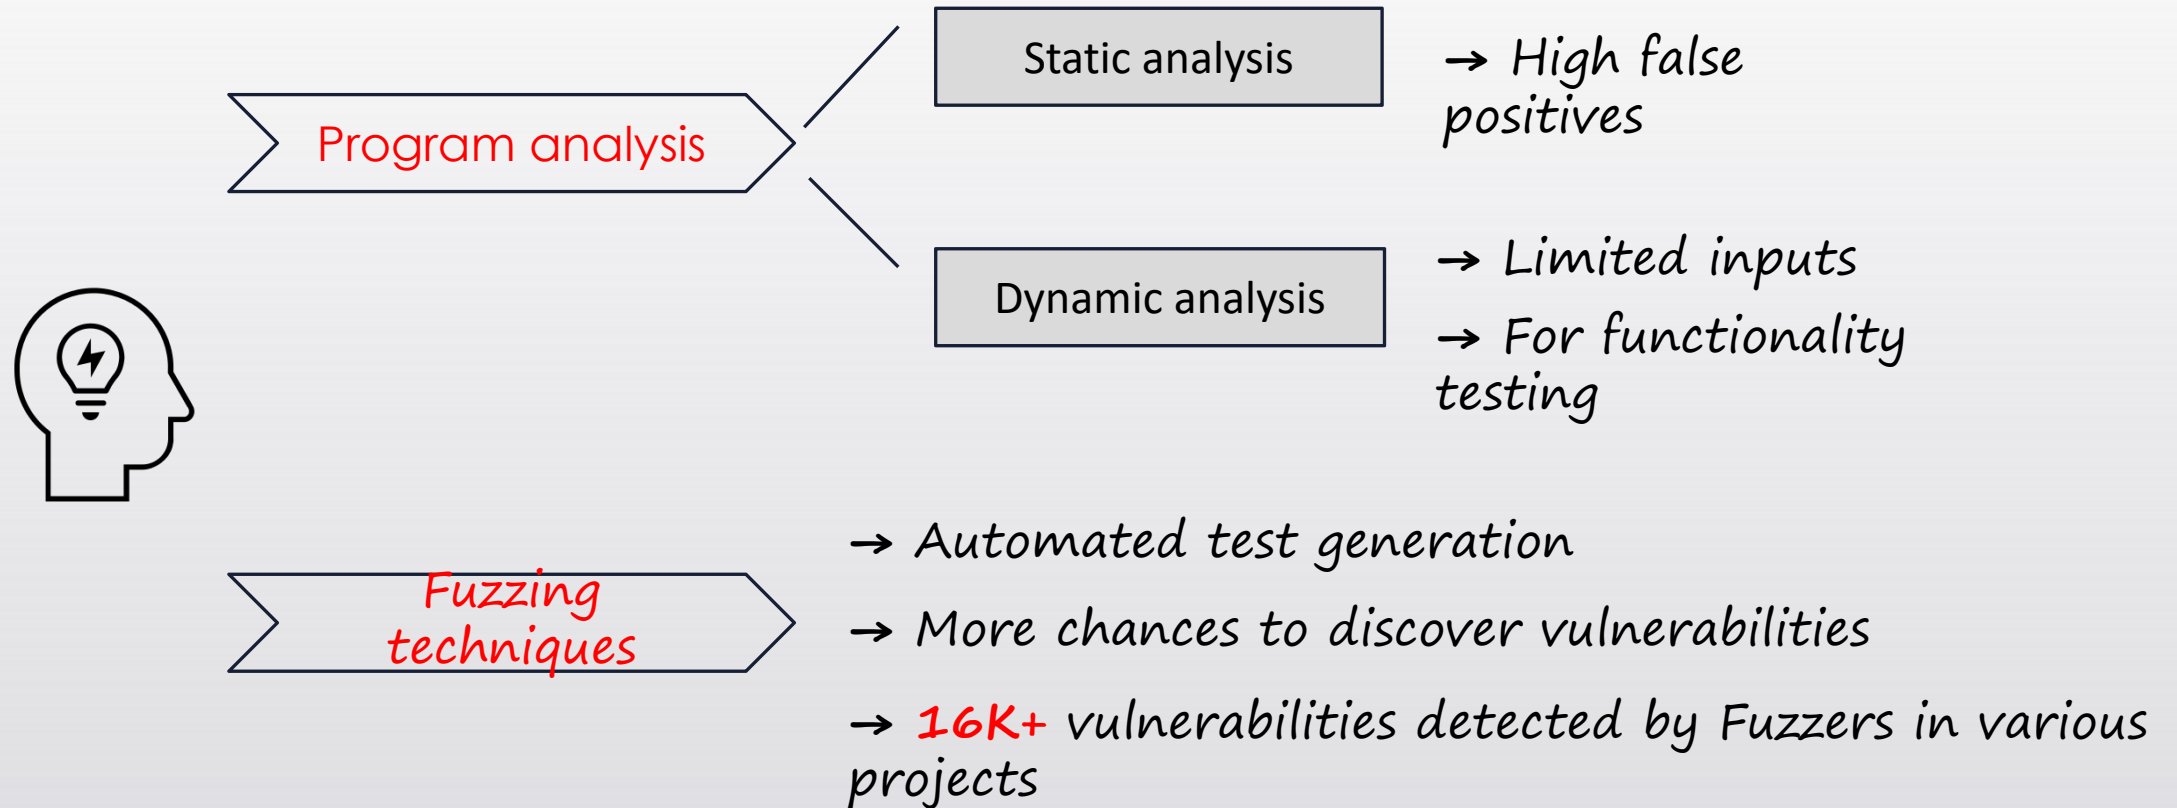

NPY_NO_EXPORT PyObject *
PyArray_NewFromDescr_int(PyTypeObject *subtype, int nd, ...) {
    .....
    if (descr->subarray) { Fixed_size_array
        npy_intp newdims[2*NPY_MAXDIMS];
        npy_intp *newstrides = NULL;
        memcpy(newdims, dims, nd*sizeof(npy_intp));
        if (strides) {
            newstrides = newdims + NPY_MAXDIMS;
            memcpy(newstrides, strides, nd*sizeof(npy_intp));
        }
    }
    .....
}

```

---▶ Data flow

## • Vulnerability detection: fuzzing is powerful and effective

- **Existing fuzzing techniques are insufficient for multi-language systems**
  - ▶ Existing fuzzing techniques primarily target single-language software
    - e.g., AFL/LibFuzzer for C program
  - ▶ Limitations when fuzzing multi-language systems
    - Feasibility for different languages
    - Inefficiency due to incomplete feedback
    - Reproducibility of vulnerabilities
  - ▶ Limitations on efficiency
    - 95%↑ mutations would be redundant!

## ● Challenges and design of PolyFuzz

### Two primary challenges:

#### → Challenge-1:

How to generate inputs that effectively exercise information flow across heterogeneous language units?

Incorporate **sensitivity analysis** to guide seed generation

#### → Challenge-2:

How to *achieve comprehensive coverage while accommodating* language extensibility?

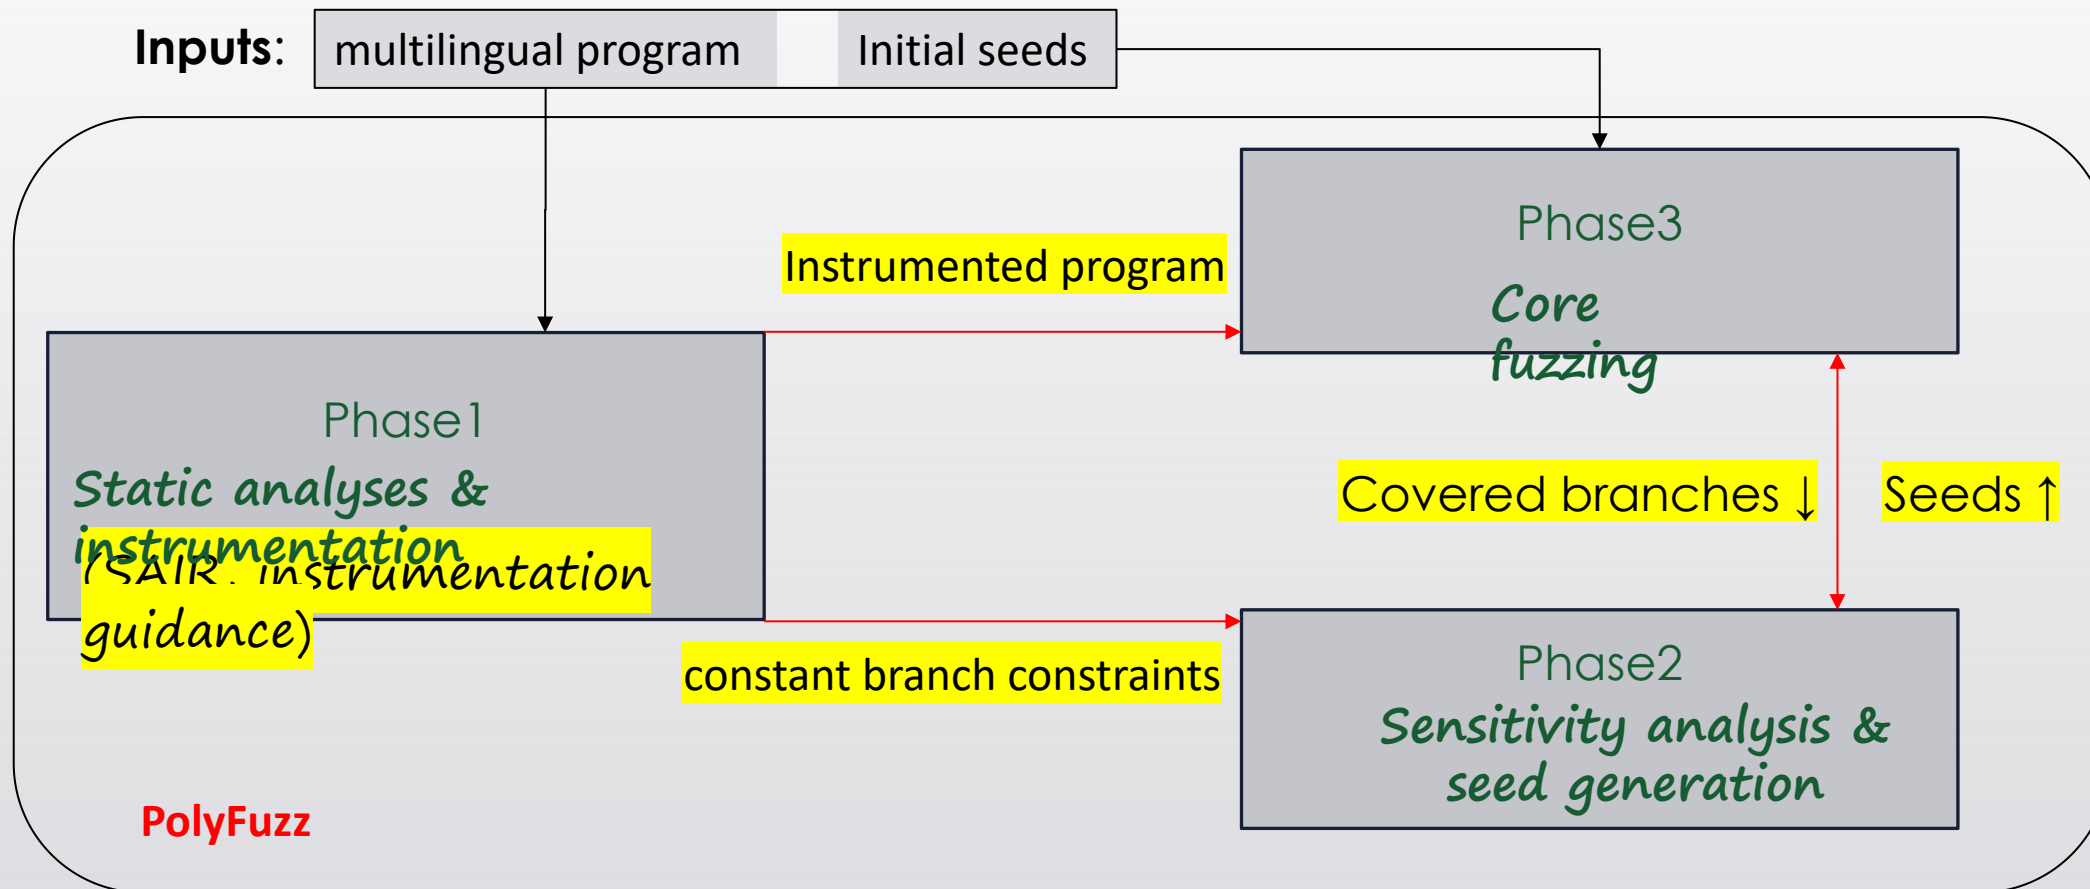

Run all heavy program analysis on a *custom* IR (**SAIR**) to minimize *language-specific analysis*

## • Overview of PolyFuzz

## • Example of Phase1: SAIR and instrumentation guidance

```

1 int func(int argc){
2  char *T;
3  int x = argc;
4  if (x == 1){
5    T = "1";
6  } else {
7    if (x > 2) {
8      T = "2";
9    } else {
10     T = "0";
11   }
12 }
13 return atoi(T);
14 }

```

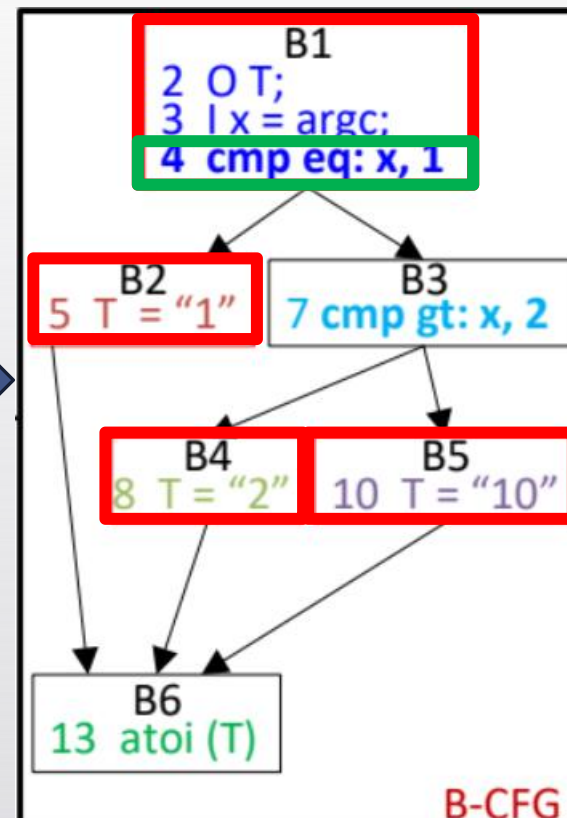

source

```

1 | func (| argc){
2  O T;
3  | x = argc;
4  cmp eq: x, 1
5  { T = "1" }
7  cmp gt: x, 2
8  { T = "2" }
10 { T = "0" }
13 atoi (T)

```

SAIR

1. Minimized block-coverage  
(distinguish all execution paths):  
→ [B1, B2, B4, B5]

2. Branch variable coverage:  
→ [B1@s4]

3. Merged guidance:  
→ [B1@s4, B2, B4, B5]

## • Example of Phase2: the procedure of seed generation

```

1 void demo(byte in[16]){
2   int do = in [0]
3   instrument (do)
4   if (do < 16) {
5     do_onething (in)
6   }
7   else {
8     int sn = in[2]*2
9     instrument (sign)
10    if (sn == 256) {
11      do_other (in)
12  }}}

```

Branch variables:

do: < 16  
sn: == 256

instantiate

do: 0 (true), 32 (false)  
sn: 256 (true), 0 (false)

input

in[0] = do  
in[2] = sn/2

predict

0,32 0 0,128 ... 84 ...

New  
seeds

Initial seed in 1-byte partition

31	0	16	...	84	...
----	---	----	-----	----	-----

0	1	2	3	4	5
---	---	---	---	---	---

Sensitivity analysis

## • Regarding the effectiveness (#block, #bug)

Baselines: Jazzer (Java), Atheris (Python), Honggfuzz (C)

Multi-language  
benchmarks

Benchmark	Jazzer	Jazz-C-ext	Atheris	Atheris-C-ext	PolyFuzz
10 Python-C (508.1 KLoC)	–	–	(1278, 1)	(5357, 3)	(1946/7319, 11)
5 Java-C (230.5 KLoC)	(1030, 0)	(1577, 0)	–	–	(1330/1976, 1)
<b>Summary</b>	↑(29.1%, 1)	↑(25.3%, 1)	↑(52.3%, 10)	↑(36.7%, 8)	–

Single-language  
benchmarks

Benchmark	Jazzer	Atheris	Honggfuzz	PolyFuzz
5 Java (332.3 KLoC)	(12319, 1)	–	–	(13675, 1)
5 Python (545.7 KLoC)	–	(3964, 1)	–	(4782, 1)
5 C (1353.5 KLoC)	–	–	(6430, 0)	(7081, 0)
<b>Summary</b>	↑(11.0%, 0)	↑(20.1%, 0)	↑(10.1%, 0)	–

## • Regarding the Vulnerabilities Discovered

Benchmark	#Bug	Symptom	#CVE
Libsmbios	1	Segment fault	0
Pillow	1	out of memory	1
Ultrajson	1	segment fault	1
Aubio	1	memory leak	0
Bottleneck	7	segment fault	1
Jansi	1	out of memory	1
Pyyaml	1	recursion error	0
Javaparser	1	JVM hung	1
<b>Summary</b>	<b>14</b>	–	<b>5</b>

CVE ID
CVE-2022-34070
CVE-2022-34072
CVE-2022-34073
CVE-2022-34074
CVE-2022-34075

▸ **PolyFuzz, a novel framework for holistic greybox fuzzing of multi-language software**

- Measurement of whole-system block coverage
- Effective seed generation via sensitivity analysis
- Language extensible

# Thanks for Your Attention

## Q & A
